KSI Rolls Out the Most Advanced Keyboard for Desktop Security

New sleek design integrates the latest, as well as legacy, technology to replace passwords

Oakland, CA - KSI (Key Source International) announced today its most amazing new line of security desktop keyboards.

The KSI-1700 series features an array of secure input options never before available in one simple keyboard design. This slim, elegant and ergonomic keyboard addresses all aspects of workstation security. The KSI-1700 has integrated options, such as biometrics, WaveID®, HID® and contact-less smart card badge technologies. What truly makes the KSI-1700 series so incredible is SonarLocID®, an option that locks and secures a user's workstation by simply walking away.

“The password era is coming to end. A secure and irrefutable logon using biometrics or RFID will become the norm when we access data”, states Phil Bruno, Sr. VP of Sales & Marketing. “Leaving an open and unattended computer defeats the purpose of strong authentication. Log off is as critical as the logon, and the SonarLocID® completes the all-important security cycle.”

The 1700 series is the sum of KSI's 30 years of innovation and expertise. This keyboard is a seamless, integrated and state of the art piece of technology that meets the needs of today's professionals in healthcare, government, banking or anyplace the need for security, workflow, durability and performance are a standard requirement.

KSI partners with RFIDeas' new WaveID® system, compatible with the over 300 million proximity badges worldwide, as well as AuthenTec, Lumidigm and UPEK. The KSI-1700 series is compatible with security solutions from Imprivata, Microsoft/Sentillion, Indigo IdentityWare, HealthCast, CA Technologies and IBM TAM Tivoli.

The KSI-1700 series is distributed through exclusive resellers BlueStar, Envoy Data and CDW in North America and DH Technologies in Australia and New Zealand.
